

ABSTRACT

A fiber-reinforced resin composition for parts of an air intake system of an internal combustion engine, which comprises a block polypropylene based resin having a MFR (230°C, 2.16 kg load) of 40 to 70 g/10 min. in an amount of 60 to 80 wt %, and a glass fiber and mica in the total amount of 20 to 40 wt %. The fiber-reinforced resin composition for parts of an air intake system of an internal combustion engine can be used for enhancing the bending modulus of elasticity of parts of an air intake system and also reducing the specific gravity thereof.
